

Demonstration Project on Production System for Drinking Water in Surabaya, Indonesia

Ishikawa Engineering

Kitakyushu: Support for the development of environmental business in Asia of small- and mid-sized companies(FY 2014) 71

Tap water in Surabaya is generally not suitable for drinking due to contamination of the river which is the main water source and ageing water pipes. Many residents boil tap water in order to use it as drinking water or purchase water in the market.

This project will install small drinking water machines in model cooperatives run by local women's groups and conduct demonstrations towards the sale of safe, secure, and low-cost drinking water.
